

Github Search Service

Build a service using gRPC that builds on top of the GitHub API to perform queries for the provided search phrase and allows for optional filtering down to the user level. You'll return the file URL and the repo it was found in.

This is the API you'll use to perform the GitHub search:

<https://docs.github.com/en/rest/reference/search>

This is the API spec that should be implemented:

```
service GithubSearchService {  
    rpc Search(SearchRequest) returns (SearchResponse);  
}  
  
message SearchRequest {  
    string search_term = 1;  
    string user = 2;  
}  
  
message SearchResponse {  
    repeated Result results = 1;  
}  
  
message Result {  
    string file_url = 1;  
    string repo = 2;  
}
```

Instructions

1. Create a new, public GitHub repository with only a README
2. Create a new branch and do all your work in that branch
3. Create a PR back into the main branch and send in the URL to the Pull Request
